

Santa's Solar Powered Sleigh

New technologies are driving changes in the renewable energy space. Massive GWh battery factories are reducing the cost of storage. EV adaption is accelerating due to climate change policy and carbon taxes. High utility power bills make residential and commercial **net metered solar** viable at grid parity costs.

If you are a developer building projects with net metering, storage, microgrids or EV charging, contact Cachelan to provide an **NRGpilot portal** for managing these systems.
